Standard Methods for Mechanical Testing of Welds

8th Edition

Supersedes AWS B4.0:2007

Prepared by the AWS Committee on B4 Committee on Mechanical Testing of Welds

Under the Direction of the AWS Technical Activities Committee

Approved by the AWS Board of Directors

Abstract

Mechanical test methods that are applicable to welds and welded joints are described. For each testing method, information is provided concerning applicable American National Standards Institute (ANSI), American Society for Testing and Materials (ASTM), and American Petroleum Institute (API) documents; the required testing apparatus, specimen preparation, procedure to be followed, and report requirements are also described.
Statement on the Use of American Welding Society Standards

All standards (codes, specifications, recommended practices, methods, classifications, and guides) of the American Welding Society (AWS) are voluntary consensus standards that have been developed in accordance with the rules of the American National Standards Institute (ANSI). When AWS American National Standards are either incorporated in, or made part of, documents that are included in federal or state laws and regulations, or the regulations of other governmental bodies, their provisions carry the full legal authority of the statute. In such cases, any changes in those AWS standards must be approved by the governmental body having statutory jurisdiction before they can become a part of those laws and regulations. In all cases, these standards carry the full legal authority of the contract or other document that invokes the AWS standards. Where this contractual relationship exists, changes in or deviations from requirements of an AWS standard must be by agreement between the contracting parties.

AWS American National Standards are developed through a consensus standards development process that brings together volunteers representing varied viewpoints and interests to achieve consensus. While AWS administers the process and establishes rules to promote fairness in the development of consensus, it does not independently test, evaluate, or verify the accuracy of any information or the soundness of any judgments contained in its standards.

AWS disclaims liability for any injury to persons or to property, or other damages of any nature whatsoever, whether special, indirect, consequential, or compensatory, directly or indirectly resulting from the publication, use of, or reliance on this standard. AWS also makes no guarantee or warranty as to the accuracy or completeness of any information published herein.

In issuing and making this standard available, AWS is neither undertaking to render professional or other services for or on behalf of any person or entity, nor is AWS undertaking to perform any duty owed by any person or entity to someone else. Anyone using these documents should rely on his or her own independent judgment or, as appropriate, seek the advice of a competent professional in determining the exercise of reasonable care in any given circumstances. It is assumed that the use of this standard and its provisions is entrusted to appropriately qualified and competent personnel.

This standard may be superseded by new editions. This standard may also be corrected through publication of amendments or errata, or supplemented by publication of addenda. Information on the latest editions of AWS standards including amendments, errata, and addenda is posted on the AWS web page (www.aws.org). Users should ensure that they have the latest edition, amendments, errata, and addenda.

Publication of this standard does not authorize infringement of any patent or trade name. Users of this standard accept any and all liabilities for infringement of any patent or trade name items. AWS disclaims liability for the infringement of any patent or product trade name resulting from the use of this standard.

AWS does not monitor, police, or enforce compliance with this standard, nor does it have the power to do so. Official interpretations of any of the technical requirements of this standard may only be obtained by sending a request, in writing, to the appropriate technical committee. Such requests should be addressed to the American Welding Society, Attention: Managing Director, Technical Services Division, 8669 NW 36 St, # 130, Miami, FL 33166 (see Annex B). With regard to technical inquiries made concerning AWS standards, oral opinions on AWS standards may be rendered. These opinions are offered solely as a convenience to users of this standard, and they do not constitute professional advice. Such opinions represent only the personal opinions of the particular individuals giving them. These individuals do not speak on behalf of AWS, nor do these oral opinions constitute official or unofficial opinions or interpretations of AWS. In addition, oral opinions are informal and should not be used as a substitute for an official interpretation.

This standard is subject to revision at any time by the AWS B4 Committee on Mechanical Testing of Welds. It must be reviewed every five years, and if not revised, it must be either reaffirmed or withdrawn. Comments (recommendations, additions, or deletions) and any pertinent data that may be of use in improving this standard are requested and should be addressed to AWS Headquarters. Such comments will receive careful consideration by the B4 Committee on Mechanical Testing of Welds and the author of the comments will be informed of the Committee’s response to the comments. Guests are invited to attend all meetings of the AWS B4 Committee on Mechanical Testing of Welds to express their comments verbally. Procedures for appeal of an adverse decision concerning all such comments are provided in the Rules of Operation of the Technical Activities Committee. A copy of these Rules can be obtained from the American Welding Society, 8669 NW 36 St, # 130, Miami, FL 33166.

Foreword

This foreword is not part of this standard but is included for informational purposes only.

This standard covers the common tests for the mechanical testing of welds. They are defined and illustrated in sections related to tension tests, shear tests, bend tests, fracture toughness tests, hardness tests, break tests (nick and fillet welds), selected weldability tests and process specific tests (stud weld tests and resistance weld tests).

This document extensively references American Society for Testing and Materials (ASTM) Standard Methods and specifies how to use these methods when testing weldments. It takes into consideration the variations in properties that can occur between different regions (base metal, heat-affected zone, and weld metal) of a weldment.

Methods of hardness testing and mechanical property tests for base metals are covered by ASTM standards or the individual material specification. The joint tests for brazements are covered in AWS C3.2M/C3.2, Standard Methods for Evaluating the Strength of Brazed Joints. Additional information on the mechanical testing of welded joints may be obtained from the AWS Welding Handbook, Ninth Edition, Volume 1, which describes selected weldability test methods.

AWS B4.0:2016, Standard Methods for the Mechanical Testing of Welds, is the eighth edition of the document initially published in 1942. The second edition (1974) incorporated metric conversions and the third edition (1977) incorporated minor changes. The fourth edition (1985) added the plane-strain fracture toughness test and the fifth edition (1992) added hardness testing and stud weld tests, and organized the tests by weld type. The sixth edition (1998) added six new weldability tests. The seventh edition included three new weldability tests (WIC, trough, and GBOP) and resistance weld tests. The current edition includes two new annexes (C and D) which address tensile testing of narrow groove welds. Several figures were updated and changes in text are indicated by a vertical margin line. Previous editions of the document are as follows:

AWS A4.0-42, Standard Methods for Mechanical Testing of Welds
AWS B4.0-74, Standard Methods for Mechanical Testing of Welds
AWS B4.0-77, Standard Methods for Mechanical Testing of Welds
AWS B4.0-85, Standard Methods for Mechanical Testing of Welds
AWS B4.0-92, Standard Methods for Mechanical Testing of Welds
AWS B4.0-98, Standard Methods for Mechanical Testing of Welds
AWS B4.0:2007, Standard Methods for Mechanical Testing of Welds

Comments and suggestions for the improvement of this standard are welcome. The should be sent to the Secretary, Committee on Standard Methods for Mechanical Testing of Welds, American Welding Society, 8669 NW 36 St, Miami, FL 33166.
Amendments

The following Amendments have been identified and incorporated in this reprint.

AWS Standard: B4.0:2016
Amendment Number: 1
Subject: Clause 7.2, replace reference ASTM A370 with ASTM E23:

ASTM Documents:

ASTM E208, Standard Method for Conducting Drop-Weight Test to Determine Nil-Ductility Transition Temperature of Ferritic Steels
ASTM E1823, Standard Terminology Relating to Fatigue and Fracture Testing

AWS Standard: B4.0:2016
Amendment Number: 1
Subject: Clause 7.5.1, replace “ASTM A370” with “ASTM E23”:

7.5.1 The apparatus for conducting the various fracture toughness tests shall be in accordance with the latest edition of the following ISO and ASTM Standard Test Methods:

(1) Charpy V-notch, ASTM E23;

AWS Standard: B4.0:2016
Amendment Number: 1
Subject: Clause 7.7.1, replace “ASTM A370” with “ASTM E23”:

7.7.1 Test specimen preparation and test procedure for measuring the fracture toughness of a weldment shall be in accordance with the following ISO and ASTM standard test methods:

(1) Charpy V-notch, ASTM E23, except that values up to and including 100% of the testing machine capacity shall be accepted and reported as fracture energy if the specimen breaks. The full machine capacity followed by a plus sign (+), shall be reported if the specimen is not broken. All these results may be used to calculate the average energy absorbed provided the minimum average required for acceptance is within the verified range of the machine;
NOTE—Dimensional Tolerances shall be as follows:

- Notch length to edge: 90° ± 2°
- Adjacent sides shall be at 90° ± 10 minutes
- Cross section dimensions: ±0.003 in (0.076 mm)
- Length of specimen (L): +0, –0.100 in (+0, –2.5 mm)
- Centering of notch (L/2): ±0.039 in (1 mm)
- Angle of notch: ±1°
- Radius of notch: ±0.001 in (0.025 mm)
- Finish requirements: 63 microinches (1.5 micrometers) Rₚ on notched surface and opposite face; 125 microinches (3 micrometers) Rₚ on other two surfaces
- Ligament length: ±0.001 in (0.025 mm)

Figure 7.1—Charpy V-Notch Impact Specimen

Standard Methods for Mechanical Testing of Welds

1. Scope

This specification establishes standard methods for mechanical testing of welds. The significance of each test, test apparatus, preparation of the test specimens, and the test procedure are described. Example test results sheets are provided.

It is beyond the scope of this document to define the required mechanical properties or acceptance criteria for the weld metal.

This standard makes sole use of U.S. Customary Units. Approximate mathematical equivalents in the International System of Units (SI) are provided for comparison in parentheses or in appropriate columns in tables and figures.

Safety and health issues and concerns are beyond the scope of this standard and therefore are not addressed herein. Safety and health information is available from the following sources:

American Welding Society:

(1) ANSI Z49.1, Safety in Welding, Cutting, and Allied Processes
(2) AWS Safety and Health Fact Sheets
(3) Other safety and health information on the AWS website

Material or Equipment Manufacturers:

(1) Safety Data Sheets supplied by materials manufacturers
(2) Operating Manuals supplied by equipment manufacturers

Applicable Regulatory Agencies

Work performed in accordance with this standard may involve the use of materials that have been deemed hazardous, and may involve operations or equipment that may cause injury or death. This standard does not purport to address all safety and health risks that may be encountered. The user of this standard should establish an appropriate safety program to address such risks as well as to meet applicable regulatory requirements. ANSI Z49.1 should be considered when developing the safety program.

2. Normative References

The following standards contain provisions which, through reference in this text, constitute mandatory provisions of this AWS standard. For undated references, the latest edition of the referenced standard shall apply. For dated references, subsequent amendments to, or revisions of, any of these publications do not apply.

AWS documents:

AWS A1.1, Metric Practice Guide for the Welding Industry;
AWS A2.4, Standard Symbols for Welding, Brazing and Nondestructive Examination; and
